# Topic 1: First - Analyze the Entire Project

## Simple RAG Project - Requirements Guide

Inspect the real repository before writing documentation.

## What this topic requires

Repository files, source code, configuration, dependencies, APIs, prompts, databases, deployment files, logging, errors, and tests.

## Required understanding and workflow

**1.** Map the repository.

**2.** Identify implemented technologies and data flow.

**3.** Record evidence from filenames and code.

**4.** Mark anything absent as NOT IMPLEMENTED IN THIS PROJECT.

**5.** Separate production recommendations from current behavior.

## Workflow

```
Repository -> evidence collection -> implementation map -> gaps and recommendations -> documentation
```

## Evidence rule

Describe implementation only after repository inspection. Missing features must be labeled NOT IMPLEMENTED IN THIS PROJECT. Recommendations must be labeled PRODUCTION RECOMMENDATION - NOT CURRENTLY IMPLEMENTED.
