Topic 16: Query Processing

Simple RAG Project - Requirements Guide

Explain what happens when a user asks a question, from request intake through the answer.

What this topic requires

The source text stops mid-topic here, so the complete request/response fields and exact query workflow still need the missing continuation and repository inspection.

Required understanding and workflow

1. Trace the request into the backend.

2. Identify validation and preprocessing.

3. Create the query embedding if implemented.

4. Retrieve and assemble context.

5. Build the prompt, call the LLM, and return the response.

6. Record the exact request and response formats from code.

Workflow

```
User question -> API request -> query processing -> retrieval -> prompt -> LLM -> API response
```

Evidence rule

Describe implementation only after repository inspection. Missing features must be labeled NOT IMPLEMENTED IN THIS PROJECT. Recommendations must be labeled PRODUCTION RECOMMENDATION - NOT CURRENTLY IMPLEMENTED.
